

Workshop 3

Implementation factors for a
Covid-19 vaccination programme in
community pharmacies

Aims and objectives of the workshop:

- To test the Nominal Group Technique (NGT) and to apply NGT virtually, pros and cons of virtual NGT
- NGT is a method to reach consensus in a group of people about a topic
- Our topic was:
 - “Rapid roll-out of a vaccination programme by community pharmacies during a pandemic: an implementation science case study”
- NGT was used to identify and prioritise the barriers to a community pharmacy based Covid-19 (Astra Zeneca) Vaccination programme
- 6 workshops

Workshop technique:

1. We started establishing groups (considering the participants' expertise with vaccination and implementation research)
2. 4 teams, each consisted of 6 members approx., meeting in breakout rooms
3. Individual brainstorming for ideas
4. Individual ranking
5. Discussion to reach group consensus within small teams on 5 most significant and 5 most changeable factors

Outcomes of W3:

- ▶ **Implementation of a covid-19 vaccination programme in community pharmacies**
- ▶ **We identified most significant and changeable factors (5)**
- ▶ **We made the assumptions on the macro level that vaccination was allowed in community pharmacies and there was a supply of vaccine and materials inside the community pharmacies**
- ▶ **Still ongoing- we finished for the significant factors but we are still deciding on the changeable factors**

Future plan:

Planning to disseminate the findings

Choosing core writing group

Setting up a follow-up- meeting
